

First, I started by downloading the Raspberry Pi software to flash the Pi with the OS and configurations I needed.

Next, I plugged in the Pi, inserted the SD card, and waited for it to go through the boot sequence

I then went back to my computer, and SSH'd into the Pi by using the command 'ssh loganpranger@pihole'

I then ran the command `curl -sSL https://install.pi-hole.net | bash` to install all the packages needed for the Pihole to run

After this, I set a static IP for the Pihole to run off

Auto	☒ ON	Logan ▾	b4:2e:99:9a:4f:87	192.168.254.13	✖
------	--	---------	-------------------	----------------	---

I then configured the DNS options on my router to run network traffic through the Pihole
